NLP Preprocessing and Text Classification

Dataset: IMDB 50K Movie Reviews

Field	Details
Name	Shivam Khedkar
Batch	1
PRN	202301040063
Assignment	4
Topic	NLP Preprocessing and Text Classification

Step 1: Upload IMDB Dataset CSV

Step 2: Install & Download NLTK Resources

```
import nltk
nltk.download('punkt')
nltk.download('punkt_tab')
nltk.download('stopwords')
nltk.download('wordnet')
nltk.download('omw-1.4')
print("NLTK resources ready!")
```

```
NLTK resources ready!
[nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data]   Package punkt is already up-to-date!
[nltk_data] Downloading package punkt_tab to /root/nltk_data...
[nltk_data]   Package punkt_tab is already up-to-date!
[nltk_data] Downloading package stopwords to /root/nltk_data...
[nltk_data]   Package stopwords is already up-to-date!
[nltk_data] Downloading package wordnet to /root/nltk_data...
[nltk_data]   Package wordnet is already up-to-date!
[nltk_data] Downloading package omw-1.4 to /root/nltk_data...
[nltk_data]   Package omw-1.4 is already up-to-date!
```

Step 3: Import Libraries

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import re
import warnings
warnings.filterwarnings('ignore')

# NLTK
from nltk.tokenize import word_tokenize
from nltk.corpus import stopwords
from nltk.stem import PorterStemmer
from nltk.stem import WordNetLemmatizer

# Sklearn — Vectorizers
from sklearn.feature_extraction.text import CountVectorizer, TfidfVectorizer

# Sklearn — Models
from sklearn.naive_bayes import MultinomialNB
```

```
from sklearn.linear_model import LogisticRegression
from sklearn.svm import LinearSVC

# Sklearn — Utilities
from sklearn.model_selection import train_test_split
from sklearn.metrics import (
    accuracy_score, precision_score, recall_score,
    f1_score, classification_report, confusion_matrix
)

print("All libraries imported!")
```

```
All libraries imported!
```

Step 4: Load & Explore Dataset

```
df = pd.read_csv('IMDB Dataset.csv', engine='python', on_bad_lines='skip')

print("=" * 55)
print("         IMDB DATASET OVERVIEW")
print("=" * 55)
print(f"Shape            : {df.shape}")
print(f"Columns          : {df.columns.tolist()}")
print(f"Null values      : {df.isnull().sum().to_dict()}")
print(f"Duplicate rows   : {df.duplicated().sum()}")
print()
print("Class Distribution:")
print(df['sentiment'].value_counts())
print()
print("Sample Reviews:")
df.head(3)
```

```
=======================================================
         IMDB DATASET OVERVIEW
=======================================================
Shape            : (22912, 2)
Columns          : ['review', 'sentiment']
Null values      : {'review': 0, 'sentiment': 0}
Duplicate rows   : 92

Class Distribution:
sentiment
negative    11518
positive    11394
Name: count, dtype: int64

Sample Reviews:
```

	review	sentiment
0	One of the other reviewers has mentioned that ...	positive
1	A wonderful little production. The...	positive
2	I thought this was a wonderful way to spend ti...	positive

Next steps: Generate code with df New interactive sheet

```
# ── EDA Plots ──────────────────────────────────────────────

Step 12: Live Sentiment Prediction on Custom Reviews

```
# Use best performing model (SVM + TF-IDF typically)
best_res   = max(results, key=lambda r: r['accuracy'])
best_clf   = best_res['model']
# Pick correct vectorizer based on model name
best_vec   = tfidf_vec if 'TF-IDF' in best_res['name'] else bow_vec

custom_reviews = [
    "This movie was absolutely fantastic! The acting was superb and the story kept me on the edge
    "Terrible film. Complete waste of time. The plot made no sense and the acting was wooden.",
    "An average movie. Some parts were enjoyable but overall it felt mediocre and forgettable.",
    "One of the best films I have ever seen. A masterpiece of storytelling and cinematography!",
    "I couldn't finish watching it. Extremely boring with no redeeming qualities whatsoever."
]

print("=" * 65)
print(f"  LIVE PREDICTIONS  |  Model: {best_res['name'].strip()}")
print("=" * 65)

for i, review in enumerate(custom_reviews):
    cleaned   = preprocess_text(review)
    vectorized = best_vec.transform([cleaned])
    pred      = best_clf.predict(vectorized)[0]
    sentiment = 'POSITIVE 😊' if pred == 1 else 'NEGATIVE 😞'
    print(f"\nReview {i+1}: {review[:75]}...")
    print(f"  → Predicted Sentiment: {sentiment}")

print("\n" + "=" * 65)
```

Summary

Component	Details
Dataset	IMDB 50K Movie Reviews (25K positive, 25K negative)
Task	Binary Sentiment Classification
Preprocessing	HTML removal → lowercase → punctuation removal → tokenization → stopword removal → lemmatization
Vectorizers	CountVectorizer (BoW), TF-IDF (1-2 grams, 10K features)
Models	Naive Bayes, Logistic Regression, SVM (LinearSVC)
Best Model	SVM + TF-IDF (~90%+ accuracy)

Key Conclusions

1. **TF-IDF consistently outperforms BoW** — penalizes overly common words.
2. **SVM with TF-IDF** achieves the highest accuracy on IMDB data.
3. **HTML tag removal** is critical for web-scraped review datasets.
4. **Bigrams** capture phrases like *not good*, *very bad*, *highly recommend*.
5. **Lemmatization** preserves meaning better than stemming.
